

STO Management

Stock Transfer Order requests, approvals & tracking — a complete guide for every role.

Audience: Requestors, Planning, Logistics, Management & Receiving teams

Access: Available in-app under [/sto](#) · App Info page

Version: Covers the current form & workflow (multi-site, weekend ship-date shift, dual management approval)

Contents

9. Finding STOs: List, Filters & Export

10. Reading an STO: Detail, Timeline & Audit

11. Analytics

12. Admin Tasks: Revert, Send Back & Archive

13. Multi-Site Access

14. Reference & Troubleshooting

Getting Started

STO Management is a web app for creating, approving, and tracking Stock Transfer Orders between sites. This guide walks through every step, organized by the role you play.

Signing in

Open the app in your browser at your organization's STO address (served under `/sto`). Sign in with your normal work credentials — access is granted through your Active Directory group for your **site** and **role** (for example `ABC_LOGISTICS`). If you can't sign in, see *Requesting Access* in Section 14.

Your role determines what you see

The app is role-aware: your dashboard, queues, and available actions all depend on your role. You may hold more than one role or cover more than one site. The six roles are:

Role	What you do
Requestor <code>receiving_site</code>	Create and submit new STO requests; track your own drafts.
Shipping Planning <code>shipping_planning</code>	Review requests for feasibility; add planning details; approve, revise, or reject.
Shipping Logistics <code>shipping_logistics</code>	Add freight & shipping details; route for management approval when required.
Management <code>management</code>	Approve high-value or cold-chain shipments at the shipping <i>and</i> receiving site.
Receiving Logistics <code>receiving_logistics</code>	Confirm receipt and close out the delivery.
Admin <code>admin</code>	Fix mistakes (revert / send back), manage archiving, oversee all sites.

Navigating the app

The top navigation bar is available on every page:

- **Dashboard** — your personal work queue and key numbers (Section 8).
- **STOs** — the searchable list of all requests with filters and CSV export (Section 9).
- **Analytics** — charts and trends across all STOs (Section 11).
- **App Info** — this guide, access requests, and administrator contacts.

TIP

Start every session on the **Dashboard**. It shows exactly what is waiting on you, so nothing sits idle.

SECTION 2

The STO Lifecycle at a Glance

Every STO moves through the same ordered path. Each hand-off is one role's responsibility. Management approval is only inserted when a shipment is high-value or cold-chain.

* Management steps are skipped automatically when approval is not required (see Section 6).

What each status means

Status	Meaning	Waiting on
Draft	Being written; not yet submitted. Editable.	Requestor
Planning Review	Submitted; under feasibility review.	Shipping Planning
Shipping Logistics	Approved by planning; freight & shipping details being added.	Shipping Logistics
Management Review	Awaiting shipping-site management sign-off.	Management (shipping)
Receiving Mgmt Review	Awaiting receiving-site management sign-off.	Management (receiving)
Receiving Logistics	Shipped; awaiting receipt confirmation & closeout.	Receiving Logistics
Closed	Delivered and closed. Requestor is notified by email.	— (complete)
Rejected	Declined at an approval step. The reason is recorded.	— (terminal)

NOTE

A request can also be **revised** back to Draft by Planning, or **sent back** a step by an Admin. In both cases a reason is attached so you know what to fix.

Creating & Submitting a Request

Requestors (and admins) create new STOs. From the **STOs** list or the Dashboard, click **New STO** to open the form.

Filling in the form

Fields are grouped into sections. Required fields are validated before you can submit.

Requestor & material

Field	Notes
Requestor name / email / requesting plant	Who the request is for.
Material (SAP) required	Exactly 8 digits .
Material description required	Plain-language description.
Quantity & UoM required	Positive whole number and unit of measure.
Brand at receiving site required	Brand as it will be labeled at destination.
MPN / Batch / Expiration	Left blank here — filled in by Planning .

Shipping details

Field	Notes
Shipping site & receiving site required	Where it ships from and to.
Shipping conditions required	Ambient, Cold 2–8 °C, Cold below 0, Frozen, or <i>Other</i> (free text). Cold-chain choices trigger management approval later.
Controlled shipping	Check if controlled; add notes if needed.

Dates & urgency

Field	Notes
Priority required	Priority 1, 2, or 3 — sets the standard estimated ship date automatically.
Rush request	Check to flag as rush. A rush reason is then required .
Standard estimated ship date	Auto-calculated (see below). Editable on rush.
Receiving site need-by date	Optional but recommended — drives "due soon" and "overdue" flags on dashboards.

Financial

Field	Notes
-------	-------

Material value required	Value of the goods. High values trigger management approval.
Inco terms / insurance	Optional commercial details.

How the estimated ship date is calculated

When you pick a priority, the app sets a **standard estimated ship date** from today:

- **Priority 1** → today + 15 days
- **Priority 2** → today + 30 days
- **Priority 3** → today + 45 days

WEEKEND SHIFT

If that date lands on a **Saturday or Sunday**, it moves to the following **Monday** automatically. The form shows a small note when this happens so the date isn't a surprise.

Submitting

Save creates or updates a **Draft** — drafts are private to you and fully editable. When ready, click **Submit**. The STO advances to **Planning Review** and appears in the Planning team's queue. You'll be told what's missing if any required field is blank.

BEFORE YOU SUBMIT

Double-check the SAP number (8 digits), quantity, sites, and — if urgent — the rush reason. After submission you can't edit directly; you'd need Planning to revise it or an Admin to send it back.

Planning Review

Planning is the first approval. You confirm the request is feasible and fill in material specifics before it moves to logistics.

Your queue

On the Dashboard, the "**Awaiting your Planning Review**" queue lists every STO at **Planning Review** for your shipping site. Open one to review it.

Adding planning details

On the STO detail page you can record:

- **MPN number**, **batch number**, and **expiration date** for the material.
- **Planning notes** — context for downstream roles.

Your three choices

Approve

Sends the STO forward to **Shipping Logistics**. Your name and time are recorded on the timeline.

Revise

Sends the STO **back to Draft** with your note attached as the reason. The requestor fixes it and resubmits. Use this for correctable issues (wrong quantity, missing detail).

Reject

Declines the request permanently (status **Rejected**). The reason is stored in the audit trail. Use this when the request shouldn't proceed at all.

TIP

Prefer **Revise** over Reject when the requestor can salvage the request — it keeps the history in one thread instead of forcing a brand-new STO.

Shipping Logistics

Logistics adds the shipping and freight details, then submits. The app decides whether management approval is needed and routes accordingly.

Your queue

The "Awaiting your Logistics Submission" queue holds STOs at **Shipping Logistics** for your site.

What you add

- **Freight cost** and shipping details.
- STO number, shipment ID, and tracking information as they become available.

What happens when you submit

The app checks four conditions. If **any** is true, the STO is routed to **Management Review** ; otherwise it goes straight to **Receiving Logistics** .

Condition	Threshold (default)
Material value is high	over \$100,000
Freight cost is high	over \$20,000
Freight is large relative to value	$\text{freight} \div \text{value} > 30\%$
Cold-chain shipping conditions	Cold 2–8 °C, Cold below 0, or Frozen

NOTE

The dollar thresholds are configured by your administrators and may differ at your organization. The behavior — high value / high freight / high ratio / cold-chain → management approval — is always the same.

The confirm pass

When management approval was required, the STO comes back to you one more time after both management approvals. On this pass you finalize the shipment — **actual ship date, estimated delivery date, PGI date, ready-to-ship** — and it then advances to **Receiving Logistics** . (It will not loop back to management again.)

Management Approval

Management sign-off protects high-value and cold-chain shipments. It happens at **both** the shipping site and the receiving site.

When it's required

Management review only appears when logistics submits an STO that meets one of the four conditions in Section 5 (high value, high freight, high freight-to-value ratio, or cold-chain). Routine shipments skip both management steps entirely.

Two approvals, in order

1. **Management Review** — **shipping-site** management approves or rejects.
2. **Receiving Mgmt Review** — **receiving-site** management approves or rejects.

Both appear in the management "**Awaiting your Management Approval**" queue. If you cover both sites, you'll see both steps.

Your choices

- **Approve** — records your sign-off and advances the STO. After the receiving-site approval, it returns to Shipping Logistics for the confirm pass (Section 5).
- **Reject** — declines the STO (status **Rejected**) with your reason recorded.

BOTH ARE REQUIRED

A management-flagged STO cannot ship until **both** shipping-site and receiving-site management have approved. If either rejects, it stops.

Receiving & Closeout

Receiving Logistics is the final human step: confirm the goods arrived and close the delivery.

Your queue

The "**Awaiting your Receipt Confirmation**" queue lists STOs at **Receiving Logistics** for your receiving site.

Confirming receipt

Record the **actual receipt date** when the shipment arrives. You can update receipt information without closing — the STO stays in **Receiving Logistics** until you're ready to finalize.

Closing out

When the delivery is complete, mark **delivery closed out**. The STO moves to **Closed** and the original requestor receives a completion email automatically.

TIP

Only close out once you've confirmed quantity and condition. Closing is the terminal step — reopening requires an admin.

Dashboard & Work Queues

The Dashboard is your home base. It filters the whole system down to just what needs *your* attention.

Your work queue

The main panel shows the STOs waiting on your role and site — the exact label depends on your role (e.g. "Awaiting your Planning Review", "Awaiting your Receipt Confirmation"). Click any row to open it.

Key numbers (KPIs)

Card	What it counts
Rush Active	Active rush requests still in flight.
Due Soon	STOs whose need-by date is close (about a week out).
Overdue	STOs past their need-by date and not yet closed.

Pipeline & recent activity

A row of pipeline pills shows how many STOs sit at each status — a quick read on where work is piling up. Below that, a **recent activity** feed lists the latest actions across the system so you can see momentum at a glance.

TIP

Watch the **Overdue** and **Due Soon** cards daily. They rely on the receiving-site need-by date, so encourage requestors to always set one.

Finding STOs: List, Filters & Export

The **STOs** page lists every request you can see, with powerful filters and one-click CSV export.

Search

The search box matches across **SAP number, material description, STO ID, and requestor name** — type any fragment to narrow the list.

Filters

Combine any of these to zero in:

Filter	Use it to...
Status	Show only one workflow stage (e.g. all Receiving Logistics).
Priority	Focus on Priority 1 / 2 / 3.
Shipping site / Receiving site	Filter by one or more sites (multi-site supported).
Requestor	All STOs from a given requestor.
Need-by date range	Everything due within a window.
Rush only	Just active rush requests.
Active only	Hide Closed and Rejected.
Has need-by	Only rows with a need-by date set.

You can also **sort by need-by date** (earliest first) to triage what's most urgent.

Export to CSV

Click **Export** to download the current view as a CSV file — handy for reporting, sharing, or offline analysis. The export respects your active filters.

NOTE

The list only ever shows STOs you're entitled to see, based on your site(s) and role. Admins see everything.

Reading an STO: Detail, Timeline & Audit

Click any STO to open its detail page — the single source of truth for that request.

What's on the page

- **All request details** — every field entered by the requestor, planning, and logistics.
- **Process timeline** — the workflow steps with the current position highlighted, so you can see how far along it is and what's next.
- **Action panel** — context-aware buttons for *your* role at the current step (approve, revise, reject, confirm, close, etc.). If it's not your turn, you'll simply see the read-only view.
- **Audit log** — a complete, timestamped record of every action, who took it, and any notes or reasons.

Spotting a hold-up

The current status and timeline tell you who the STO is waiting on. If it's been sitting a while, check the audit log for a **revise** or **send-back** reason — the request may be waiting on a fix from an earlier role.

TIP

When a request has been sent back, the reason appears prominently. Read it first — it tells you exactly what needs to change before it can move on.

Analytics

The Analytics page turns all your STOs into charts and trends for reporting and planning.

What you'll find

- **Summary KPIs** — totals for all, active, closed, and rejected STOs, plus total value and rush count.
- **Status distribution** — how STOs are spread across the workflow.
- **Monthly trends** — volume and value over time.
- **Site flows** — how many STOs move from each site to each other site.
- **Rush split** — rush vs. normal volume month by month.
- **Raw data table** — searchable and exportable underlying rows.

Use the filters (status, rush, date range) to focus a chart on a period or category.

TIP

The site-flow view is useful for capacity planning — it reveals which lanes carry the most volume.

Admin Tasks: Revert, Send Back & Archive

Admins can correct workflow mistakes and manage long-term data retention. These actions are available on the STO detail page and dashboard.

Revert (step back)

Moves an STO **back one step** in the workflow — useful when something advanced by mistake. It clears the current step's reason. You can click it repeatedly to step back several stages.

Send Back (step back with a reason)

Like Revert, but requires a **mandatory note**. The note is attached to the STO so the role receiving it knows exactly what to fix. Prefer Send Back over Revert whenever the earlier role needs instructions.

USE SPARINGLY

Revert and Send Back move an STO backward against the normal flow. Every use is logged in the audit trail. Always add a clear reason so the history stays understandable.

Archiving

Closed or rejected STOs older than **5 years** can be soft-archived to keep the working set fast. From the dashboard, admins can **preview** how many records are eligible and then **run** the archive. Archived records are hidden from normal lists but not deleted.

Multi-Site Access

Many users cover more than one site. The app supports this throughout — your queues, lists, and approvals span all the sites you're assigned to.

- Your access is defined by your Active Directory groups, one per *site* + *role* (e.g. `ABC_LOGISTICS` and `ABL_LOGISTICS`).
- Dashboard queues automatically include work from **every** site you cover.
- On the STOs list, the shipping-site and receiving-site filters accept **multiple sites at once**.
- Management users can act on both the shipping-site and receiving-site approval steps for their assigned sites.

NOTE

If you should see a site's STOs but don't, you may be missing that site's AD group. Request it via the App Info page (Section 14).

Reference & Troubleshooting

Requesting access

Access is granted by Active Directory group membership for your **site** and **role** (e.g. [ABC_PLANNING](#)). Use the **Requesting Access** link on the **App Info** page and include the site(s) and role you need. For help, contact an administrator (listed on the same page) or your IT service desk.

Status quick reference

Status	Owner	Next step
Draft	Requestor	Submit → Planning Review
Planning Review	Shipping Planning	Approve → Shipping Logistics
Shipping Logistics	Shipping Logistics	Submit → Management or Receiving Logistics
Management Review	Management (shipping)	Approve → Receiving Mgmt Review
Receiving Mgmt Review	Management (receiving)	Approve → Shipping Logistics (confirm)
Receiving Logistics	Receiving Logistics	Close out → Closed
Closed / Rejected	—	Terminal

Common questions

I submitted an STO but can't edit it anymore.

Once submitted, an STO is read-only to the requestor. Ask Planning to *revise* it back to Draft, or an Admin to *send it back*.

My STO went to management approval — why?

It met a threshold: high material value, high freight cost, a high freight-to-value ratio, or cold-chain shipping conditions (Section 5).

The estimated ship date isn't what I expected.

It's calculated from priority (15 / 30 / 45 days) and shifts to Monday if it lands on a weekend (Section 3).

I can't see STOs for one of my sites.

You're probably missing that site's AD group. Request it via App Info.

An STO was closed by mistake.

Contact an admin — reopening a closed STO requires the revert/send-back tools.

STO Management — User Guide. This guide is available any time from the **App Info** page inside the app. For access issues or corrections, contact an administrator listed on that page.
